Pseudophakic cystoid macular edema treatment guidelines

The American Heart Association This leading heart association offers a wide range of resources for heart disease, including heart failure, which can lead to swelling (swelling). The website lists practical tips for dealing with swelling and available treatments. Heart Failure Society of America This website has been launched as a forum for heart failure experts to discuss all things related to heart failure, heart failure, and congestive heart disease. The patient section of the site has information about apps to manage heart failure and tools with information about living well with the condition. HeartFailure.org Developed by two heart failure specialists, the website lays out the basics of heart failure. There's also a prevention section with in-depth information on proper nutrition to reduce the risk of fluid retention or swelling, and what you need to know about sodium or water. The Mayo Mayo Clinic, a world-class heart treatment center, has created a list of many diuretics - a type of medication that can help treat swelling. Your doctor will most likely choose the drugs included in this list, making it a good resource for you to learn about taking the drugs properly and immediately reporting any problems. MedlinePlus MedlinePlus is a health resource from the National Library of Medicine with all materials reviewed by medical staff. This handout on liquids and diuretics offers tips on how to limit weight gain and excess fluid with tips about trying hard candy instead of a drink when you want to drink or rinse your mouth with cold water and then spit out water. Favorite Edema Health Storylines Management Appst's free app, produced in partnership with the Heart Failure Society of America, allows you to track many important things related to swelling, such as weight and symptoms such as feeling full or swelling. If your weight shows a steep increase within a day or two, you will get a hint to call a doctor. Patient reviews say that the drug tracker is limited to a set list, so check to see if your drugs are listed before you sign up. HF Path This is a free app from the American Heart Association that tracks important information such as medication schedule, symptoms and weight. The app sends an alert if your journal indicates swelling seriously enough to call a doctor. The app also has online courses on heart failure problems such as swelling, as well as the possibility of group chats with others who have heart failure. Favorite online support groups for people with CHF and Edema American Heart Association While CHF related swelling usually don't have their own support group, this is a common problem. You will find a lot of discussion in this forum on weight gain swelling that can help you answer questions and find support. Home Eye Conditions Conditions, A-I Review by Michael DePaolis, OD What is Macular Degeneration? Macular degeneration (also called age-related macular degeneration or AMD) is a condition in which the eye's waste paper is destroyed, causing gradual or sudden loss of the central Macular degeneration is always caused by age? Macular degeneration usually affects people over 65 years of age, so the term age-related macular degeneration (AMD) is often used to describe the condition. However, some drugs can cause macular degeneration, and some cases are inherited, such as Stargardt's disease, which can affect children and young adults. Is it true that macular degeneration is becoming an increasingly serious problem? Yes. Dr Bert Dubow, an optometrist and member of the editorial advisory board of the AllAboutVision.com, explains: Experts believe there are a number of reasons for this: more ultraviolet light in our environment due to the thinning of the ozone layer, people living longer, environmental pollutants, smoking, poor nutrition, obesity, etc. Another factor may be our ageing population, as the risk of macular degeneration increases with age. While there are no sure ways to prevent macular degeneration, you should wear glasses or sunglasses that provide 100 percent UV protection and a brimmed hat when outdoors. You should also consider exercising, not smoking, eating a healthy diet that includes lots of dark green leafy vegetables (spinach, kale, greens, etc.), protecting your eyes from blue light, and visiting your eye care doctor on a regular basis for eye exams to check AMD. Who is most at risk of macular degeneration? If you are over 65 years old, a smoker, white or a family member with AMD, you have an increased risk of macular degeneration. You are also at risk if you take these drugs: Aralen (chloroquine) or phenothiazine derivatives of Torazine (chlorpromazine), Mellaril (thioridazine), Prolislin (flufenazine), Trilafon (perfenazine) and steleazine (trifluorazin) . Is there a way to prevent macular degeneration? Doctors do not know how to prevent macular degeneration. Studies show that ultraviolet light (and possibly blue light) factors in the problem, so sunglasses that block these sunbeams can have a protective effect. What you eat also affects your macula. Researchers believe that antioxidants (vitamin A, C and E), zinc, lutein, zeaxanthin and essential fatty acids can help prevent macular degeneration. Read more about nutrition and eye health. Exercising and quitting smoking can also reduce the risk of AMD. What are the signs and symptoms of macular degeneration? Early signs of macular degeneration include: straight lines appear wavy, fuzzy vision, night vision problems, and dark areas in your central vision. Your eye doctor may find indicators before you have any symptoms, so regular eye examinations can mean early diagnosis. One way to find out if you have these vision problems is to view the Amsler grid, which is a diagram of the black lines in the graph. here to see how the Amsler grid works. What are the different types of macular degeneration? Macular degeneration is classified as dry or wet. Dry form is more common than moist (about 90 percent of patients). This may be the result of the result of and thinning of macular tissues, pigment deposition in the macula or combination of the two. In a wet form, new blood vessels grow under the retina and leak blood and fluid. This leak causes the death of retinal cells and creates blind spots in the central vision. Is macular degeneration curable? No, but treatment can slow or even stop the progression of the wet form, so the sooner you are diagnosed, the better. What macular degeneration treatment is currently available? Currently, there are a number of FDA-approved medical procedures for wet AMD, including eye injections of Lucentis, Macugen and Eylea. Learn more about macular degeneration treatment. Photocoagulation is a type of laser surgery that can sometimes slow vision loss in patients with a wet form of macular degeneration. Currently, there are no FDA-approved medical procedures for dry AMD. However, a number of drug candidates are being developed and evaluated in clinical trials. Based on clinical studies that have shown certain nutrients and antioxidants can slow the progression of dry AMD, some eye doctors recommend specific dietary supplements for people who are either at risk of macular degeneration or have early signs and symptoms of AMD. Patients who have significant vision problems caused by macular degeneration can often benefit from low vision devices to help them read, use a computer and more. The page is updated December 2017 Macular swelling swelling or fluid retention in a specialized part of the retina called the macula. The macula is located at the back of the eye and provides us with clear, central vision. This is the part of the retina we use when we target our vision to look at the target. Fluid from abnormal, leaking blood vessels can flow in the macula. When the swelling of the macula occurs, the central vision is distorted or reduced. Anthony Lee/Getty Images Macular swelling can be a sign or symptom of many other conditions. Diabetes is the most common cause of macular edema. Macular swelling is also common in people who have uncontrolled high blood pressure. Some eye diseases, such as retinitis pigmentosa and uveitis, can also cause macular swelling. Macular swelling can also be a complication of eye surgery. Some medications used to treat glaucoma, such as latanoprost (Xalatan) have also been known in rare cases to cause macular swelling. The doctor will first listen to your complaints and cause a medical history such as diabetes or with recent eye surgery. Next, they will measure your visual acuity by having you cover one eye and reading the letters on the eye chart. Typically, macular sedul causes vision to become blurred. Doctors can also give you a test called Amsler Grid to see if your vision not only blurred, but distorted. Special eye drops will be injected to enlarge your pupil so that the inside of the eye can be visualized. Macular swelling can be seen in many cases simply by looking at the macula from the microscope's slit lamp. Microscope. more subtle cases are hard to see. In this case, oct will be performed. An OCT image can allow doctors to view individual layers of the retina. Optical consistency tomography is a non-invasive test that uses light to produce images where macular swelling can be seen very easily. Sometimes doctors can also use a dye injection test so that blood flow can be analyzed through the macula. Macular swelling is treated differently depending on

the underlying cause. For example, if uncontrolled diabetes or high blood pressure is the cause, treatment may be aimed at controlling these conditions in the first place. However, if the symptoms are severe or if the doctor is concerned that swelling may cause vision loss or damage, it will be treated with medication or injections. Often non-steroidal anti-inflammatory drug (NSAIDs) is prescribed in the form of an eye drop. It may have to take weeks and sometimes months to control the swelling. Doctors also prescribe corticosteroids in the form of topical eye drops or oral tablets. Corticosteroids can also be injected in or around the eyes. Another class of drugs called anti-VEGF (vascular endothelial growth factor) drugs are administered directly to the eye. This fairly new class of drugs is acting to reduce existing abnormal blood vessels and prevent the growth of new flowing blood vessels. Thank you for your feedback! What do you care? Problems?
